UC-01: Display List of Available Products With Images, Descriptions, Prices, and Ratings

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Display List of Available Products With Images, Descriptions, Prices, and Ratings” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-01 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: None.
Postconditions	Measurable system state: outputs match the SRS specification (List of products with details); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: None. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System display list of available products with images, descriptions, prices, and ratings

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-02: Filter and Display Relevant Products Based on Inputs

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Filter and Display Relevant Products Based on Inputs” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-02 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Keywords, filters (category, price range, rating).
Postconditions	Measurable system state: outputs match the SRS specification (Subset of products matching criteria); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: Keywords, filters (category, price range, rating). 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System filter and display relevant products based on inputs

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-03: Update Shopping Cart Database With New Entry

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Update Shopping Cart Database With New Entry” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-03 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Selected product ID, quantity.
Postconditions	Measurable system state: outputs match the SRS specification (Confirmation message and updated cart summary); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: Selected product ID, quantity. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System update shopping cart database with new entry

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	According to normal operational load implied by the SRS.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-04: Calculate Total Cost, Apply Discount/coupon If Applicable, Generate Order Confirmation

Primary Actor	Customer
Stakeholders and Interests	Primary actor (Customer): achieve “Calculate Total Cost, Apply Discount/coupon If Applicable, Generate Order Confirmation” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-04 is in scope. Customer is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Shopping cart contents.
Postconditions	Measurable system state: outputs match the SRS specification (Order summary interface with payment form); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Customer supplies inputs required by the SRS: Shopping cart contents. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System calculate total cost, apply discount/coupon if applicable, generate order confirmation

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Customer may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Customer behaviour is limited to what the SRS assigns to this actor.

UC-05: Input: Credit Card Number, Expiration Date, Cvv, Billing Address Processing: Encrypt...

Primary Actor	Customer
Stakeholders and Interests	Primary actor (Customer): achieve “Input: Credit Card Number, Expiration Date, Cvv, Billing Address Processing: Encrypt...” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): External payment authority (boundary system) when settlement is out of scope for the subject system.
Preconditions	SRS traceability: functional requirement FR-05 is in scope. Customer is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Credit card number, expiration date, CVV, billing address.
Postconditions	Measurable system state: outputs match the SRS specification (Receipt sent to customer's email); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Customer supplies inputs required by the SRS: Credit card number, expiration date, CVV, billing address. 2. System evaluates inputs against the rules implied by the SRS for this requirement.

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Customer may correct data and resume at step 1. Payment or authorization refusal: transaction does not commit; system records the failure state per SRS. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Customer behaviour is limited to what the SRS assigns to this actor.

UC-06: Validate Inputs, Update Database Accordingly

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Validate Inputs, Update Database Accordingly” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-06 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: New product details, existing product ID, changes.
Postconditions	Measurable system state: outputs match the SRS specification (Success/failure message); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: New product details, existing product ID, changes. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System validate inputs, update database accordingly

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-07: Adjust Inventory Records

Primary Actor	Administrator
Stakeholders and Interests	Primary actor (Administrator): achieve “Adjust Inventory Records” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-07 is in scope. Administrator is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Product ID, stock level change.
Postconditions	Measurable system state: outputs match the SRS specification (Updated inventory status); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Administrator supplies inputs required by the SRS: Product ID, stock level change. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System adjust inventory records
Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Administrator may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).

Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	According to normal operational load implied by the SRS.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Administrator behaviour is limited to what the SRS assigns to this actor.

UC-08: Retrieve and Display Order Details

Primary Actor	Customer
Stakeholders and Interests	Primary actor (Customer): achieve “Retrieve and Display Order Details” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): External payment authority (boundary system) when settlement is out of scope for the subject system.
Preconditions	SRS traceability: functional requirement FR-08 is in scope. Customer is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Order ID.
Postconditions	Measurable system state: outputs match the SRS specification (Order summary with status); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Customer supplies inputs required by the SRS: Order ID. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System retrieve and display order details
Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Customer may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).

Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	According to normal operational load implied by the SRS.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Customer behaviour is limited to what the SRS assigns to this actor.

UC-09: Display List of Available Products With Images, Descriptions, Prices, and Ratings (2)

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Display List of Available Products With Images, Descriptions, Prices, and Ratings” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-01 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: None.
Postconditions	Measurable system state: outputs match the SRS specification (List of products with details); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: None. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System display list of available products with images, descriptions, prices, and ratings

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-10: Filter and Display Relevant Products Based on Inputs (2)

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Filter and Display Relevant Products Based on Inputs” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-02 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Keywords, filters (category, price range, rating).
Postconditions	Measurable system state: outputs match the SRS specification (Subset of products matching criteria); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: Keywords, filters (category, price range, rating). 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System filter and display relevant products based on inputs

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-11: Update Shopping Cart Database With New Entry (2)

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Update Shopping Cart Database With New Entry” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-03 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Selected product ID, quantity.
Postconditions	Measurable system state: outputs match the SRS specification (Confirmation message and updated cart summary); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: Selected product ID, quantity. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System update shopping cart database with new entry

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	According to normal operational load implied by the SRS.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-12: Calculate Total Cost, Apply Discount/coupon If Applicable, Generate Order Confirmation (2)

Primary Actor	Customer
Stakeholders and Interests	Primary actor (Customer): achieve “Calculate Total Cost, Apply Discount/coupon If Applicable, Generate Order Confirmation” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-04 is in scope. Customer is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Shopping cart contents.
Postconditions	Measurable system state: outputs match the SRS specification (Order summary interface with payment form); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Customer supplies inputs required by the SRS: Shopping cart contents. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System calculate total cost, apply discount/coupon if applicable, generate order confirmation

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Customer may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Customer behaviour is limited to what the SRS assigns to this actor.

UC-13: Input: Credit Card Number, Expiration Date, Cvv, Billing Address Processing: Encrypt... (2)

Primary Actor	Customer
Stakeholders and Interests	Primary actor (Customer): achieve “Input: Credit Card Number, Expiration Date, Cvv, Billing Address Processing: Encrypt...” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): External payment authority (boundary system) when settlement is out of scope for the subject system.
Preconditions	SRS traceability: functional requirement FR-05 is in scope. Customer is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Credit card number, expiration date, CVV, billing address.
Postconditions	Measurable system state: outputs match the SRS specification (Receipt sent to customer's email); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Customer supplies inputs required by the SRS: Credit card number, expiration date, CVV, billing address. 2. System evaluates inputs against the rules implied by the SRS for this requirement.

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Customer may correct data and resume at step 1. Payment or authorization refusal: transaction does not commit; system records the failure state per SRS. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Customer behaviour is limited to what the SRS assigns to this actor.

UC-14: Validate Inputs, Update Database Accordingly (2)

Primary Actor	User
Stakeholders and Interests	Primary actor (User): achieve “Validate Inputs, Update Database Accordingly” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-06 is in scope. User is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: New product details, existing product ID, changes.
Postconditions	Measurable system state: outputs match the SRS specification (Success/failure message); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. User supplies inputs required by the SRS: New product details, existing product ID, changes. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System validate inputs, update database accordingly

Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; User may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. Service timeout or unavailability: system preserves integrity and signals unavailability without corrupting state. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).
Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	High frequency during active use; response remains within SRS timing expectations.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. User behaviour is limited to what the SRS assigns to this actor.

UC-15: Adjust Inventory Records (2)

Primary Actor	Administrator
Stakeholders and Interests	Primary actor (Administrator): achieve “Adjust Inventory Records” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): None stated in the SRS excerpt.
Preconditions	SRS traceability: functional requirement FR-07 is in scope. Administrator is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Product ID, stock level change.
Postconditions	Measurable system state: outputs match the SRS specification (Updated inventory status); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Administrator supplies inputs required by the SRS: Product ID, stock level change. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System adjust inventory records
Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Administrator may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).

Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	According to normal operational load implied by the SRS.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Administrator behaviour is limited to what the SRS assigns to this actor.

UC-16: Retrieve and Display Order Details (2)

Primary Actor	Customer
Stakeholders and Interests	Primary actor (Customer): achieve “Retrieve and Display Order Details” successfully and traceably to the SRS. Product owner / sponsor: acceptance against the originating requirement. Supporting actors (if any): External payment authority (boundary system) when settlement is out of scope for the subject system.
Preconditions	SRS traceability: functional requirement FR-08 is in scope. Customer is permitted to invoke this capability under the SRS. Inputs needed for the main flow are available: Order ID.
Postconditions	Measurable system state: outputs match the SRS specification (Order summary with status); persistent data and session state remain consistent with that outcome.
Main Success Scenario	1. Customer supplies inputs required by the SRS: Order ID. 2. System evaluates inputs against the rules implied by the SRS for this requirement. 3. System retrieve and display order details
Extensions	Alternate flows — None beyond the exception flows below when the SRS defines no optional branches. Exception flows — Invalid or incomplete inputs: system rejects with a clear reason; Customer may correct data and resume at step 1. Processing failure: system avoids inconsistent commits, notifies the actor, and records diagnostics as required. UML note: Where the same mandatory sub-behaviour appears in multiple use cases, model it once and apply <<include>> from each affected use case (per SRS, not by inventing new scope).

Special Requirements	Non-functional constraints are exactly those stated in the SRS; this use case does not add implementation detail.
Frequency of Occurrence	According to normal operational load implied by the SRS.
Assumptions	The SRS is the sole authority on scope; this use case adds no latent requirements. Customer behaviour is limited to what the SRS assigns to this actor.
